

Employee Attrition – Key Findings and Recommendations

- **Overall attrition rate:** About **16%** of employees left the company (roughly 1 in 6) highlighting a meaningful turnover that HR should address.
- **Departments at risk:** The **Sales Department** has the highest turnover (around **21%** of sales staff resigned), far above other departments. Human Resources and R&D have lower rates (~19% and 14%, respectively).
- **Job roles at risk:** Within Sales, **Sales Representatives** see the highest exits (nearly **40%** of them leave). **Laboratory Technicians** also have high turnover (~24%). These roles should be top priorities for retention efforts.
- **Factors beyond salary:** Lower-paid employees are leaving more often (employees who left earned on average **₹4,800** per month vs **₹6,800** for those who stayed), but **salary alone is not the main cause**. The analysis shows **work conditions** matter more:
 - Employees working **regular overtime** are much more likely to resign.
 - Employees who **travel frequently for work** also have higher attrition.
 - **Other insights:** Employees in job roles like Sales and Technical positions report more pressure and less satisfaction. Without intervention, these high-pressure roles see steady losses of experienced staff.

Recommendations

1. **Focus on high-risk groups:** Prioritize retention efforts for the Sales Department and critical roles (Sales Reps, Lab Technicians).
2. **Improve work-life balance:** Review overtime and travel demands.
3. Adjust workloads so that employees are not routinely overworked.
4. Introduce flexible scheduling or remote work options where possible to reduce burnout.
5. Recognize and reward teams that maintain healthy work hours.
6. **Engage and listen:** Conduct regular employee surveys and “stay interviews” especially for those in high-turnover roles.
7. Identify issues (e.g., too much travel, lack of support) before they become reasons to quit.
8. Implement quick fixes for common complaints, such as better staffing or adjusted targets.

Limitation

This analysis uses company HR data only. It cannot capture personal factors (such as family moves or outside job offers) or cultural issues (like manager-employee relationships). Therefore, these findings should **guide** but not **dictate** HR decisions. Use this insight as a tool to flag at-risk groups, but continue to rely on personal interaction and judgment for final decisions.
